

TDEI76 Lecture 5

Digital Platforms and Platform Ecosystems

What are digital platforms and platform ecosystems

Microsoft Dynamics 365 Business Central

Microsoft 365

Developer Tools

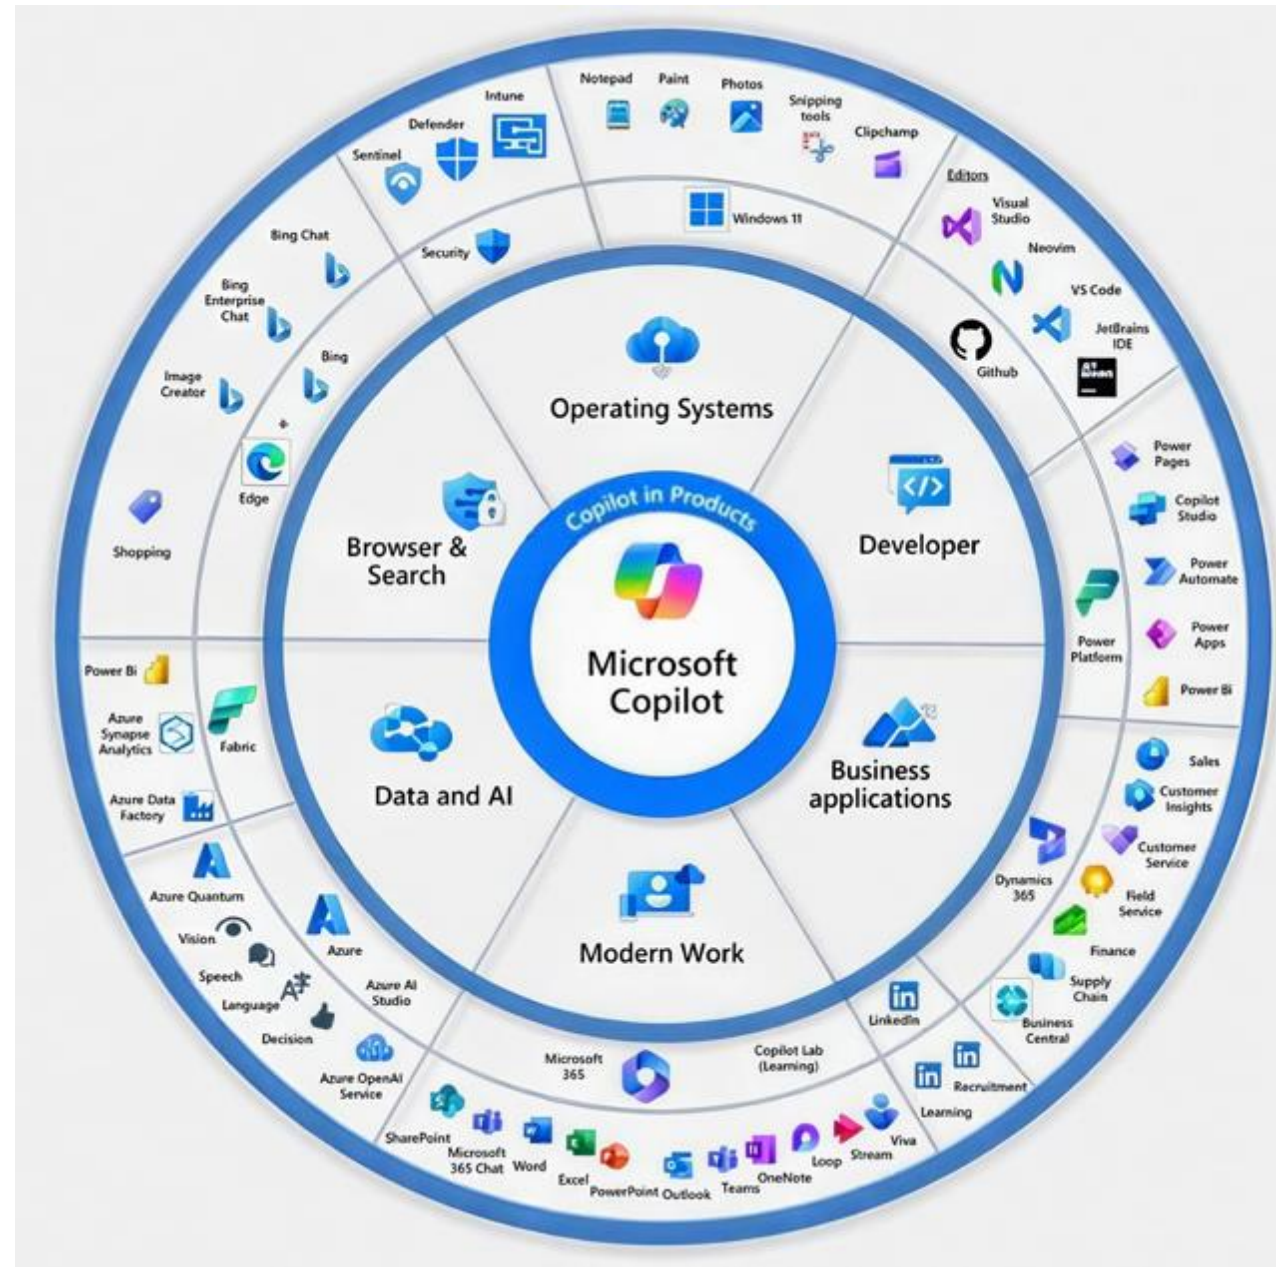

Power Platform

Microsoft Azure

Identity, security, management, and compliance

RANK 	NAME	COUNTRY/TERRITORY	SALES	PROFIT	ASSETS	MARKET VALUE
1	JPMorganChase	United States	\$252.91 B	\$50.05 B	\$4,090.73 B	\$588.09 B
2	Berkshire Hathaway	United States	\$368.96 B	\$73.42 B	\$1,070.04 B	\$899.14 B
3	Saudi Arabian Oil Company (Saudi Aramco)	Saudi Arabia	\$489.07 B	\$116.95 B	\$661.54 B	\$1,919.26 B
4	ICBC	China	\$223.85 B	\$50.38 B	\$6,586.01 B	\$215.2 B
5	Bank of America	United States	\$183.28 B	\$25.03 B	\$3,273.8 B	\$307.26 B
6	Amazon	United States	\$590.74 B	\$37.68 B	\$530.97 B	\$1,922.1 B
7	China Construction Bank	China	\$199.84 B	\$47.01 B	\$5,403.8 B	\$187.5 B
8	Microsoft	United States	\$236.58 B	\$86.18 B	\$484.27 B	\$3,123.13 B
9	Agricultural Bank of China	China	\$193.5 B	\$37.38 B	\$5,832.95 B	\$170.94 B
10	Alphabet	United States	\$317.92 B	\$82.41 B	\$407.35 B	\$2,177.68 B

3 out of 10 top firms are platform businesses

Page 10 of 10

Boudreau, 2010:
Platform architecture

Cusumano, 2022:
Data platforms and network effects

Ahmed and Kowalkowski, 2025:
Distinct platform types and governance

Topics to be covered

Digital platforms
and ecosystems

Relationship
between ERPs and
platforms

Network effects and
data network effects

Platform
governance

Platform typologies
from different
perspectives

Definitions

Digital platforms

Information technology artifacts with specific development affordances. They serve as amalgamations of digital resources that facilitate interaction and exchange among participants, enable the provision of interconnected products and services and optimize operational resource usage through effective monitoring and controlling.

Platform ecosystems

Systems characterized by multilateral connections among firms and their activities, fostering synergies and complementarities that would not emerge otherwise

Connection between ERPs and Platforms? (contd.)

A manufacturing firm using **SAP S/4HANA** (ERP) might connect it to **Siemens MindSphere** (a digital platform). The ERP manages production schedules, while the platform enables real-time equipment monitoring and predictive maintenance using IoT data. These two work in tandem—ERP ensures execution, the platform drives insight and optimization.

How different are platforms from ERPs?

Aspect	Digital Platforms	ERP Systems
Primary Purpose	Enable interaction, value co-creation, and innovation across actors	Integrate and streamline internal business operations
Users	Internal and external (partners, customers, developers)	Primarily internal (employees, management)
Architecture	Open, modular, API-based; often multi-sided	Centralized, modular, often enterprise-specific
Data Flow	Multi-directional across ecosystem participants	Unidirectional, focused on internal processes
Value Creation	Through ecosystem participation and 'network effects'	Through operational efficiency and process automation

Network effects on digital platforms

A fundamental concept in digital platforms, describing how the value of a product or service increases as more people use it. This phenomenon indicates that user interactions can enhance the platform's utility for all participants.

Direct or Same-side network effects:

The value of the platform increases directly with the number of users.

A social media platform becomes more valuable as more friends join and interact.

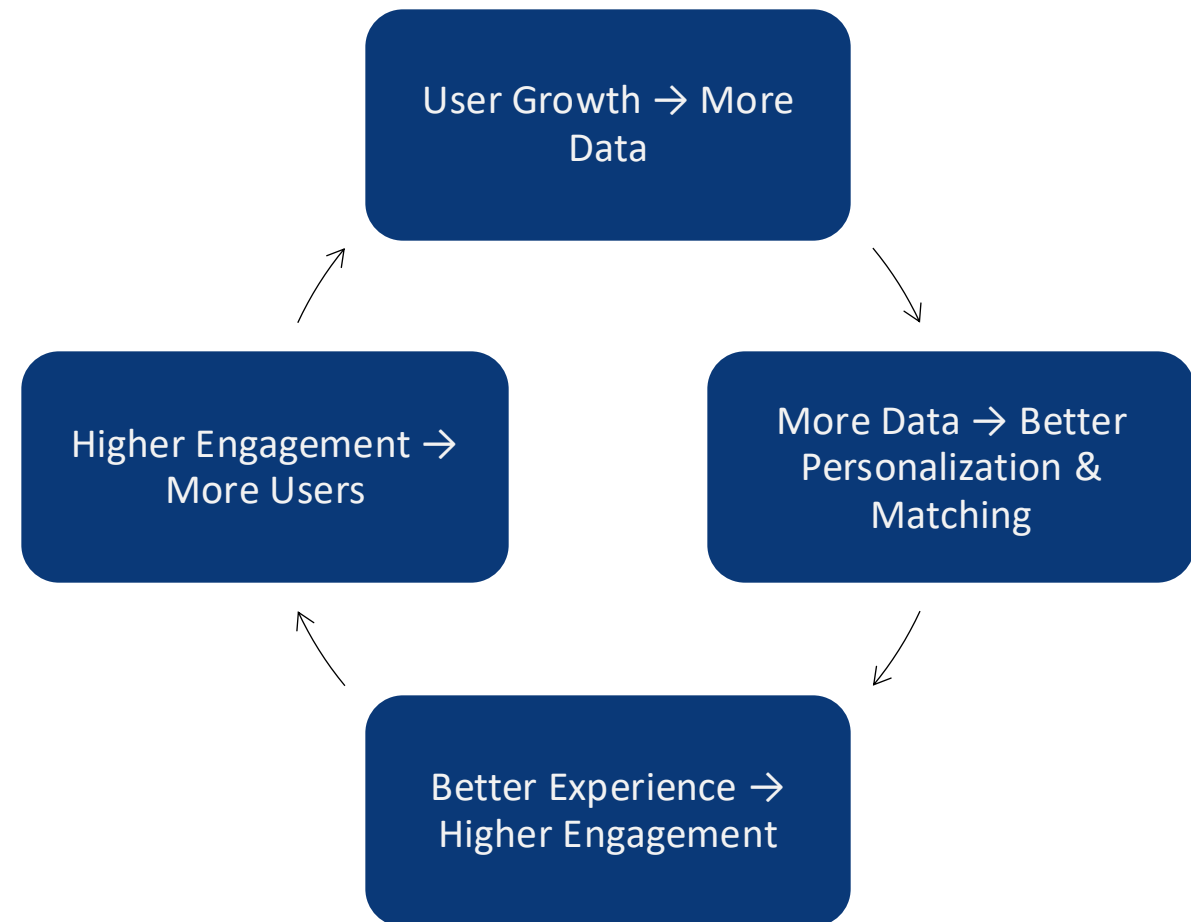

Indirect or Cross-side network effects:

The value to one group of users increases as the size of another group grows.

More app developers on a mobile platform attract more users, and vice versa.

Data network effects on digital platforms

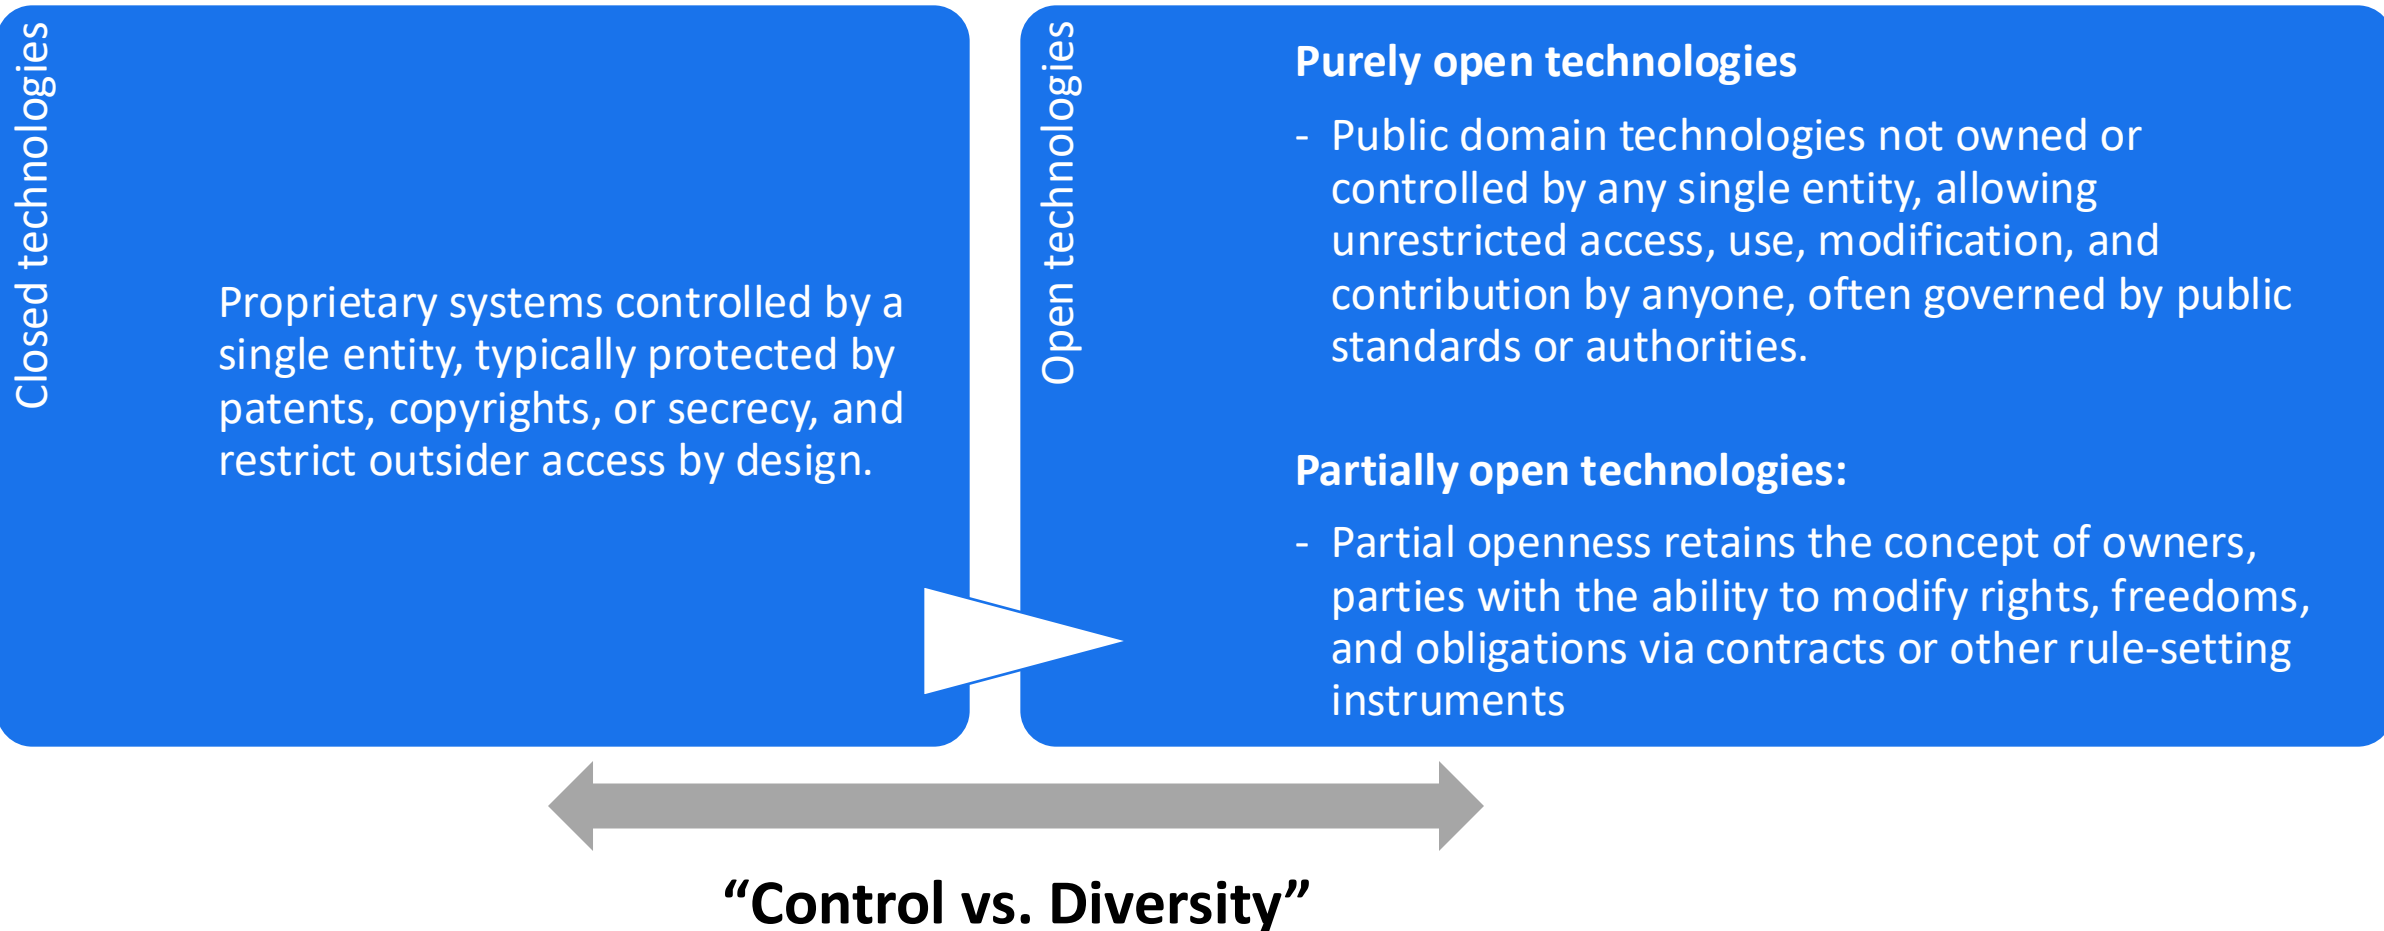

The data network effect (*resembling direct or same-side network effect*) on a digital platform occurs when increased user activity generates more data, which the platform uses to optimize its features, algorithms and services, leading to a better experience for all users, attracting even more users—thus, creating a self-reinforcing loop.

Platform typology

Based on technology architecture

Based on value proposition

Transaction platforms

Facilitate exchanges between different user groups, such as buyers and sellers.

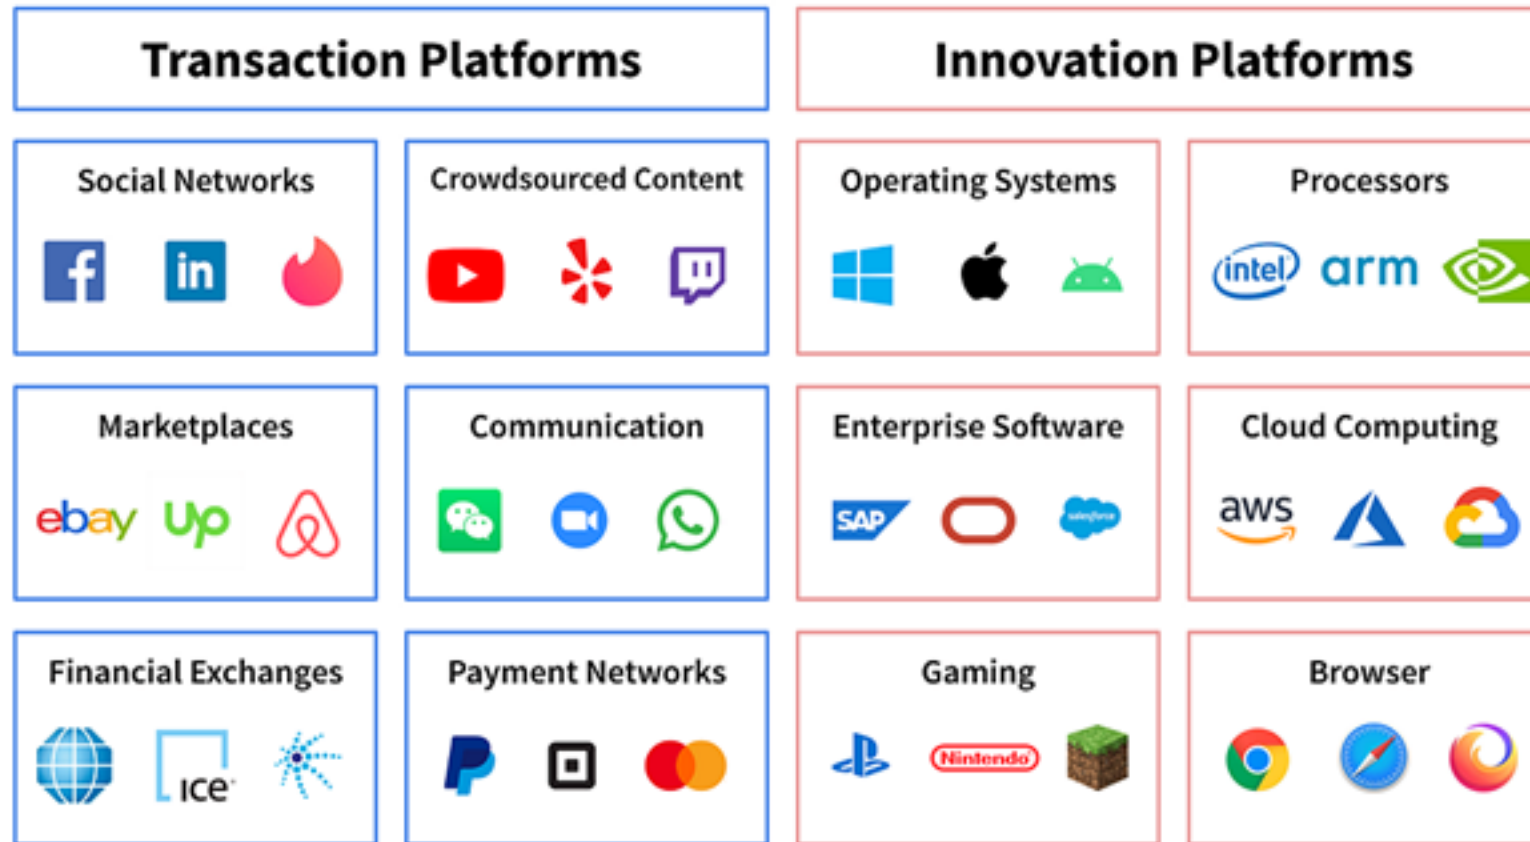

- Enable transactions by matching supply and demand efficiently.
- Centralized governance, with the platform owner controlling the rules of interaction, data access, and fee structures.
- Amazon, Uber, eBay.

Innovation platforms

Provide a foundation upon which external developers can build complementary products or services.

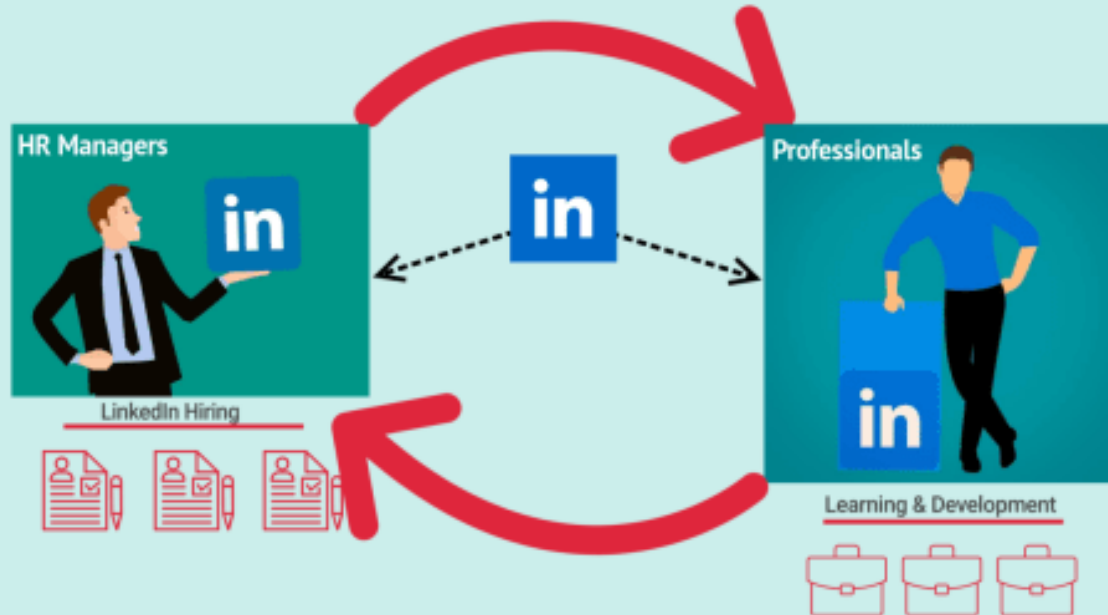

- Foster innovation by offering tools, APIs, or services that others can use to develop new applications.
- More open governance, encouraging third-party contributions while maintaining certain standards and protocols.
- Android, AWS, Apple's App Store.

Examples of Transaction and Innovation platforms

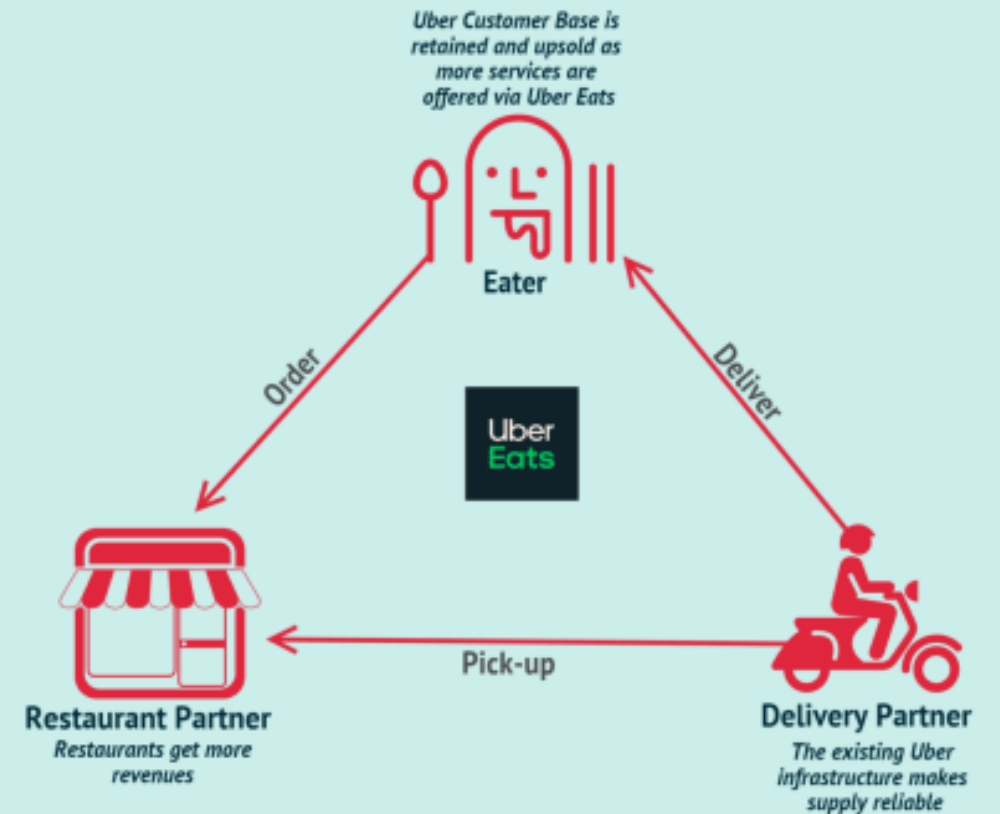

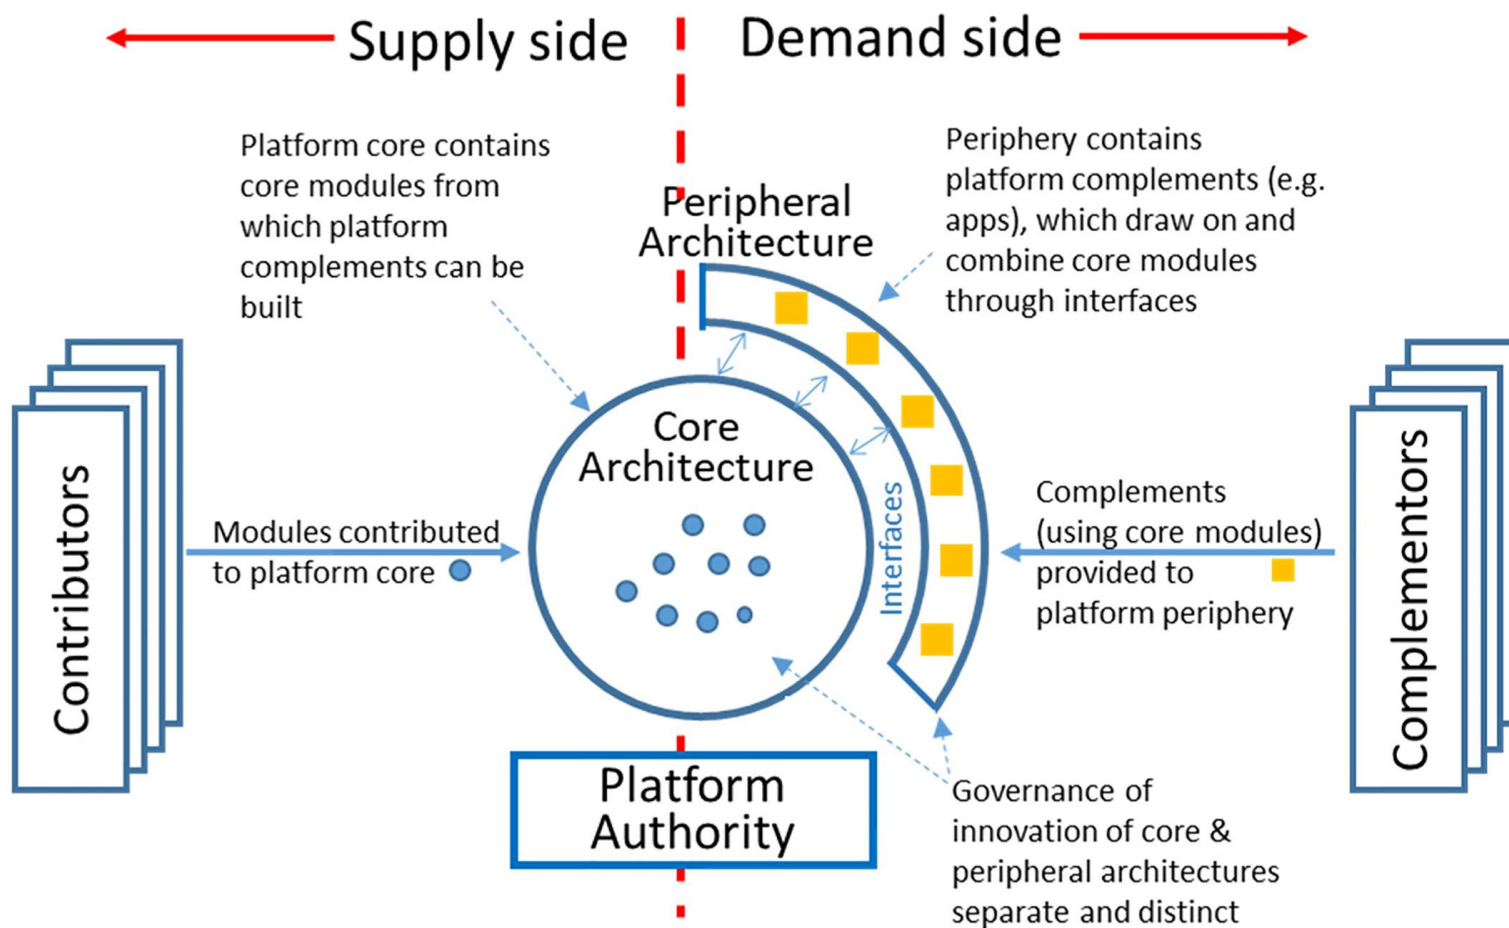

Transaction platforms

Two-Sided Network Effects

Three-Sided Network Effects

Innovation platforms

How do firms heighten platform governance?

Governance through boundary resources

- Ad-hoc APIs
- Standard/ generic technology adapters
- Customized technology adapters

- SDKs for app developers
- SDKs for the customer
 - Supporting Low-code and No-code development

How do firms enable their platforms for interoperability?

Firms develop their platform architecture and governance gradually following a “punctuated leap” pattern

Activities undertaken for platform evolution

Internal Congruence

Service
Orientation

Customer
Experience
Management

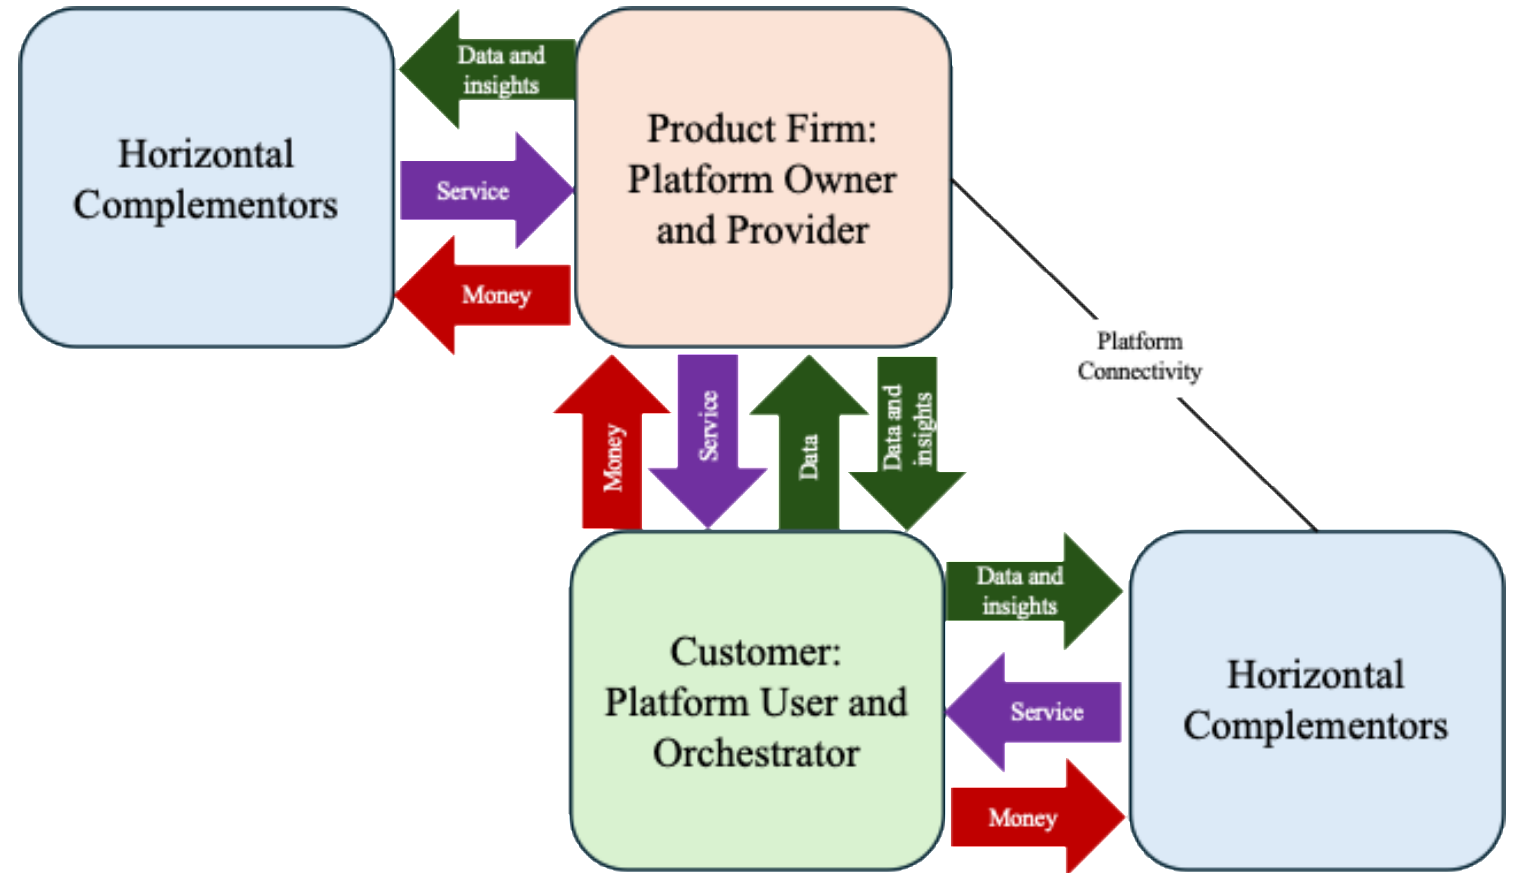

Platform typologies based on

- Idiosyncratic Business Models
- Distinct platform orchestration and ownership

1. MANUFACTURER- LED PLATFORM

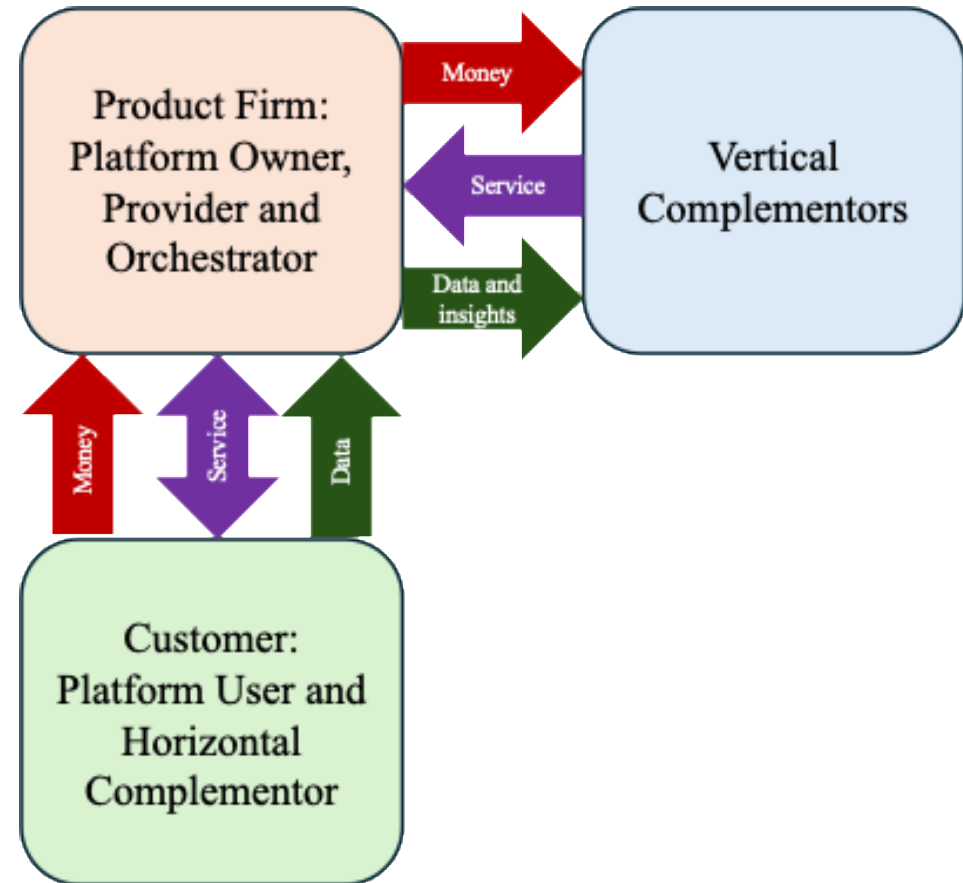

2. PROVIDER MEDIATED PLATFORM (SAAS)

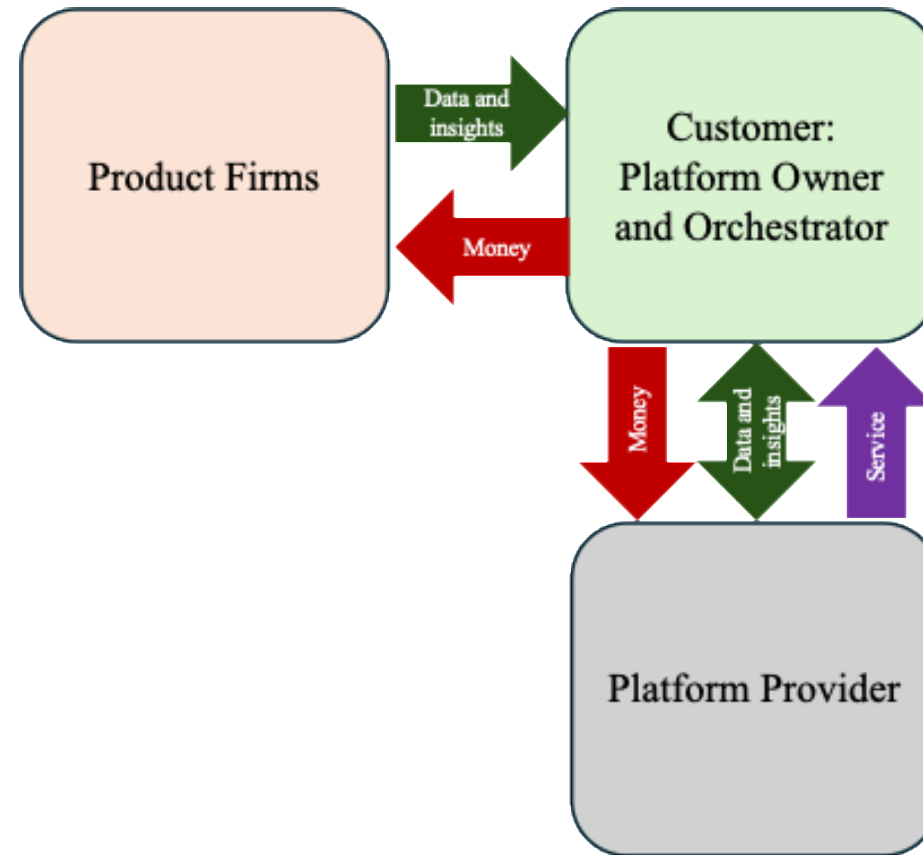

3. CUSTOMER INNOVATION PLATFORM (PAAS)

*ENABLES LOW-CODE AND
NO-CODE DEVELOPMENT BY
PROVIDING SDKS*

4. CUSTOMER-MODERATED PLATFORM

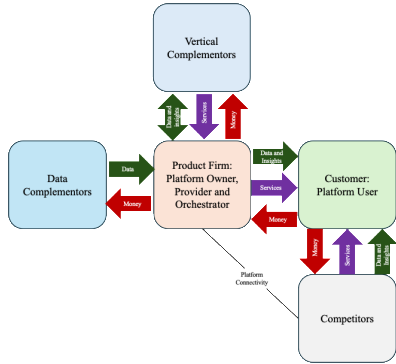

5. DATA BROKERAGE PLATFORM

*MANAGES GENERIC AND
CUSTOMIZED TECHNOLOGY
ADAPTERS*

Snapshot of nuanced platform characteristics

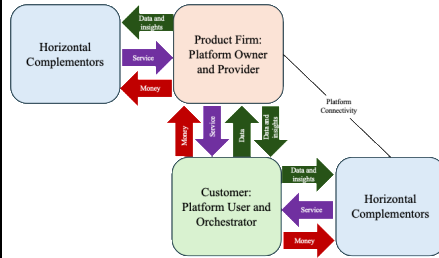

Manufacturer-led

Product firms are the platform owners and orchestrators: Integrate vertical complementors to add value, focus on data acquisition and analysis.

Expanded service offering by integrating complementarities

Significant cost for interoperability

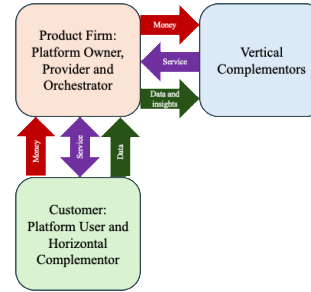

Provider-mediated

Product firms are owners and platform providers, while the customers are the Orchestrator: Use customer data for service optimization.

Optimizing service quality by integrating complementarities

Less freedom for data interoperability

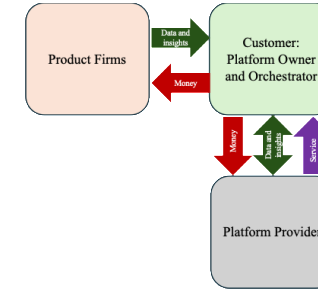

Customer innovation

Product firms are platform owners, providers and orchestrators: Provide tools for customer-led innovation and development.

Empowering customers to add value through innovation

Decentralized platform governance

Customer-moderated

Customers are platform owners and orchestrators, while software firms are providers: Utilize external insights for customers' innovations.

Customer-driven decision-making on service optimization

Limited external connectivity

Data brokerage

Data brokers own and operate platforms: Integrate data buyers and sellers to facilitate ecosystem-wide data sharing.

Creating data monetization opportunities for the ecosystem

Do not provide service innovation on platforms

Seminar instructions

- Form groups and discuss the questions.
- Based on your answers to the questions, create a recommendation to the BSI management team in 1-3 PowerPoint slides about:
 - What should BSI do with BLUE going forward? Is it a good strategic option?
 - How should BLUE be developed? Pick and explain one of these options:
 1. *Adopt as-is*
 2. *Adapt – how should it be adapted?*
 3. *Dismiss, i.e., don't proceed and stop the platform development project.*

Thank you!
